# 1 CAN OPEN

Name	Description	Min	Max	Default	UM	Scale
ID_CANOPEN	P162 - CAN BUS node ID	1	127	1		1
CANOPEN_BAUD_SEL	C48 - CAN Baud rate	Range		0		1
		0	1 M			
		2	500 k			
		3	250 k			
		4	125 k			
		5	50 k			
		6	20 k			
7	10 k					
EN_FLDBUS_REF	E47 - Enable FIELD-BUS reference values	0	1	0		1
PRC_T_REF_FLDBUS	D69 - Fieldbus Torque reference	-400	400	0	% MOT_T_NOM	40.96
PRC_T_MAX_FLDBUS	D71 - Fieldbus Torque Max reference	-400	400	0	% MOT_T_NOM	40.96
PRC_SPD_REF_FLDBUS	D75 - Fieldbus Speed reference	-100	100	0	% MOT_SPD_MAX	163.84
SPD_REF_PULS_FLDBUS	D78 - Fieldbus Speed Reference in Pulses			0	Pulses per Tpwm	1
PRC_APP_T_REF	D10 - Torque reference value (application generated)	-100	100	0	% MOT_T_NOM	40.96
PRC_APP_T_MAX	D32 - Maximum torque limit by application	-100	100	0	% MOT_T_NOM	40.96
PRC_APP_SPD_REF	D33 - Speed reference (application generated)	-100	100	0	% MOT_SPD_MAX	163.84
PRC_APP_T_MIN	D48 - Minimum torque limit by application	-100	100	0	% MOT_T_NOM	40.96
PRC_APP_FRQ_SPD_REF	D14 - Frequency speed reference value (application generated)	-100	100	0	% MOT_SPD_MAX	163.84
EN_SYNC_REG	C23 - Enable CANOpen SYNC tracking loop	0	1	0		1
SYNC_REG_KP	P11 - CanOpen SYNC loop regulator Proportional gain	0	200	5		1
SYNC_REG_TA	P12 - CanOpen SYNC loop regulator lead time constant	0	20000	400		1
SYNC_DELAY	Delay from SYNC reception to Speed routine execution			0	us	1
PWM_SYNC_OFFSET	PWM offset for SYNC delay control			0	pulses	1
STATE_SM	Actual states of the state machine			0		1
CYCLE_TIME	Can open: Cycle period in us (Obj 0x1006) - EtherCAT: Sync0 cycle time in ns			0		1
MAPPING_CONFIG	U03 - Select the mapping configuration	0	32767	0	Hex	1
PDO_MAPPING	PDO mapping - the value is configured with MAPPING CONFIG			0	Hex	1
BO_CAN_MOD	Bus-off status. If 1 the CAN module is in bus-off status			0		1
REC_CAN_MOD	CAN receive error counter			0		1
TEC_CAN_MODE	CAN transmit error counter			0		1

## 1.1 CONFIGURATION OF THE NODE

The drive configuration as CAN node includes the use of the following customer parameters ( of conventional use ):

Name	Description	Min	Max	Default
ID_CANOPEN	P162 - CAN BUS node ID	1	127	1
CANOPEN_BAUD_SEL	C48 - CAN Baud rate	Range		0
		0	1 M	
		1		
		2	500 k	
		3	250 k	
		4	125 k	
		5	50 k	
		6	20 k	
7	10 k			

These parameters must be rightly configured and saved in the permanent memory of the drive (C63=1). At start up these data are considered and become operating.

## 1.2 CONFIGURATION OF THE COMMUNICATION OBJECTS

The configuration of the communication objects CAN OPEN DS301 can uniquely be done via CAN. At first switch on, the drive is a non-configured node which satisfies the “pre defined connection set” for the identifiers allocation; for this, the following objects are available:  
rx SDO with COB-ID = 600h + ID CAN node (parameter P162)  
tx SDO with COB-ID = 580h + ID CAN node  
an emergency object with COB-ID = 80h + ID CAN node  
NMT objects (Network Management) : in broadcast (COB-ID=0) for Module Control services and COB-ID = 700h + ID CAN node for Error Control.  
The SYNC object in broadcast with COB-ID = 80h  
With the SDO available, the drive can be totally configured as CAN node and only after the communication objects can be saved in the permanent memory using the proper command “store parameters” (1010h) on the Sub-Index 2.  
Also the object “restore default parameters (1011h)” Sub-Index 2 is managed to load all the default communication objects and to save them automatically in the permanent memory (switch off and then on the drive to make objects operating ).

## 1.3 MANAGED SERVICES

### 1.3.1 Service Data Object (Sdo)

SDO are used to access the objects dictionary. In our implementation a maximum of 4 server SDO can be available which can be configured with the following objects:

- 1200h 1<sup>st</sup> server SDO parameter
- 1201h 2<sup>nd</sup> server SDO parameter
- 1202h 3<sup>rd</sup> server SDO parameter
- 1203h 4<sup>th</sup> server SDO parameter

The transfer mode depends on the length of the data to be transferred : up to 4byte data length, the modality *expedited* is used as it is simple and immediate; for bigger size objects the modality *segmented* and *block* are both supported. See the specific Communication Profile DS301 for having details on the different transmission modes; hereinafter are written only some peculiarities of our implementation:

- a writing access to SDO must indicate the number of significant byte (data set size)
- the writing data by SDO is liable to the same rules ( drive state, keys, tolerated range...) seen for the other modalities of parameters modify (serial and keyboard).
- If SDO are structured in more segments, the drive will start writing the data at the indicated address with the first segment, without using a temporary buffer

- A controller is intended to avoid that two SDOs access the same object at the same time.
- With the transmission in block modality, the computation of CRC and the “Protocol Switch Threshold” are not supported.
- It is possible to set the block size of the SDO Block Download service at the address 2000h of the objects dictionary, in the manufacturer specific section.

### 1.3.2 Process Data Object (Pdo)

PDO are used for the data exchange in real-time in the objects dictionary that supports this function.

### 1.3.3 Transmit Pdo

In our implementation up to a maximum of 4 TPDO can be configured with the following objects :

1800h 1<sup>st</sup> Transmit PDO Communication parameter

1801h 2<sup>nd</sup> Transmit PDO Communication parameter

1802h 3<sup>rd</sup> Transmit PDO Communication parameter

1803h 4<sup>th</sup> Transmit PDO Communication parameter

the 5 Sub-Index related to every type of TPDO are all managed : it is possible to set the transmission type (see the following table), the inhibit time with 100µs resolution and the period of the event timer with 1ms resolution

transmission type	PDO transmission
0	Acyclic synchronous: data are transmitted every SYNC received only if its value is changed from previous message.
1-240	Synchronous and cyclical: the number indicates how many SYNC are in between two following transmissions
241-251	----- reserved -----
252	Data are refreshed and sent at the following RTR when the SYNC is received
253	Data are refreshed and sent when the RTR is received (remote transmission request)
254	Event timer : cyclical transmission with a period time settable in ms in the Sub-Index 5
255	Manufacturer specific : it is settable time by time

Note: in the transmission type 255, it is possible to choose on which event the TPDO transmission works. The event choice can be effectuated only during the compiling the software code.

The TPDO mapping can be dynamically effectuated by rightly configuring the following communication objects:

1A00h 1<sup>st</sup> Transmit PDO Mapping parameter

1A01h 2<sup>nd</sup> Transmit PDO Mapping parameter

1A02h 3<sup>rd</sup> Transmit PDO Mapping parameter

1A03h 4<sup>th</sup> Transmit PDO Mapping parameter

the PDO mapping must be done by following these instructions:

- 1- the number of the mapped objects in Sub-Index 0 must be equal to zero
- 2- the addresses of all mapped objects must be configured
- 3- the correct number of mapped objects in the Sub-Index 0 must be indicated

### 1.3.4 Received Pdo

In our implementation a maximum of 4 RPDO can be configured with the following objects:

1400h 1<sup>st</sup> Receive PDO Communication parameter

1401h 2<sup>nd</sup> Receive PDO Communication parameter

1402h 3<sup>rd</sup> Receive PDO Communication parameter

1403h 4<sup>th</sup> Receive PDO Communication parameter

The first 2 Sub-Index related to each RPDO are managed: in this way it is possible to set the transmission type:

transmission type	PDO receiving
0-240	synchronous: when the following SYNC is received, the values received on the RPDO will be activated.
241-253	----- reserved -----
254	Asynchronous: the values received in the RPDO are immediately activated.

The RPDO mapping can be dynamically effectuated by rightly configuring the following communication objects:

- 1600h 1<sup>st</sup> Receive PDO Mapping parameter
- 1601h 2<sup>nd</sup> Receive PDO Mapping parameter
- 1602h 3<sup>rd</sup> Receive PDO Mapping parameter
- 1603h 4<sup>th</sup> Receive PDO Mapping parameter

RPDO mapping must be executed by following the next directives as well:  
 Set the number of mapped objects in Sub-Index 0 to be equal to zero  
 Configure the addresses of all mapped objects  
 Indicate the correct number of mapped objects in Sub-Index 0

## 1.4 EMERGENCY OBJECT (EMCY)

The emergency object is transmitted by the drive when a new enabled alarm comes trough or when one or more alarms are reset. The Emergency telegram is made by 8 byte as shown in the following table:

Byte	0	1	2	3	4	5	6	7
meaning	Emergency		Error	Manufacturer specific				
	Error Code		register	alarms LSB –MSB				

In our implementation only two codes of the error code are implemented :

- 00xx = Error Reset or No Error
- 10xx = Generic Error

Speaking of the Error register (object 1001h), the following bits are managed corresponding to the following alarms:

Bit	Meaning	Corresponding alarms
0	General error	all
1	Current	A3
2	Voltage	A10 - A11 -A13
3	temperature	A5 - A6

In Manufacturer specific the bytes 3 and 4 are assigned with the state of the various alarms of the drive, and byte 5 is the alarm sub-code. Further 2 bytes for the transmission of possible other user's data are available.

The management of 1003h "pre-defined error field " object memorises the chronology of the alarm events (from start up of the drive) up to a maximum of 32 elements.

At every new alarm event 4 bytes are memorised, 2 are mandatory and correspond to the Error Code; the other 2 are Manufacturer specific and in our specific case correspond to the state of all the drive alarms.

MSB		LSB	
Additional information		Error code	
alarms MSB	alarms LSB	Error code MSB	Error code LSB

## 1.5 NETWORK MANAGEMENT OBJECTS (NMT)

This function allows the NMT master to check and set the state to every NMT slave.

All the services of Module Control and also the Node Guarding Protocol which uses the COB-ID = 700h + ID CAN node are implemented: this allows the slave to communicate that the bootup ended and the pre-operational modality is active, thus the master can interrogate the different slaves with an RTR.

The Life guarding function is implemented as well: the drive (NMT slave) can be set up by the objects:

100Ch	<b>Guard time</b> in ms	} their product yields the <b>Node life time</b> note: node life time is internally saturated in the period time of 32767/fpwm sec.
100Dh	<b>Life time factor</b> (multiplier factor)	

Life guarding is enabled only if life time Node is different to zero; in this case the check-up starts after having received the first RTR from the NMT master.

The Communication profile DS301 doesn't decide which action it has to start if the time constrain of life guarding hasn't been respected. It's possible to decide how to act, during the firmware compilation step. By default, no action is done.

## 1.6 OBJECTS DICTIONARY : COMMUNICATION PROFILE AREA

The following objects of the communication profile are supported:

Index (hex)	Object	Name	Type	Access
1000	VAR	Device type	UNSIGNED32	Reading
1001	VAR	Error register	UNSIGNED8	Reading
1002	VAR	Manufacturer status register	UNSIGNED32	Reading
1003	ARRAY	Pre-defined error field	UNSIGNED32	Reading
1005	VAR	COB-ID SYNC	UNSIGNED32	Reading/writing
1006	VAR	Communication cycle period	UNSIGNED32	Reading/writing
1008	VAR	Manufacturer device name	Vis-String	constant
1009	VAR	Manufacturer hardware version	Vis-String	constant
100A	VAR	Manufacturer software version	Vis-String	constant
100C	VAR	Guard time	UNSIGNED16	Reading/writing
100D	VAR	Life time factor	UNSIGNED8	Reading/writing
1010	ARRAY	Store parameters	UNSIGNED32	Reading/writing
1011	ARRAY	Restore default parameters	UNSIGNED32	Reading/writing
1014	VAR	COB-ID EMCY	UNSIGNED32	Reading/writing
1015	VAR	Inhibit Time EMCY	UNSIGNED16	Reading/writing
1018	RECORD	Identity Object	Identity (23h)	Reading
1200	RECORD	1 <sup>st</sup> Server SDO parameter	SDO parameter	Reading/writing
1201	RECORD	2 <sup>nd</sup> Server SDO parameter	SDO parameter	Reading/writing

Index (hex)	Object	Name	Type	Access
1202	RECORD	3 <sup>rd</sup> Server SDO parameter	SDO parameter	Reading/writing
1203	RECORD	4 <sup>th</sup> Server SDO parameter	SDO parameter	Reading/writing
1400	RECORD	1 <sup>st</sup> receive PDO parameter	PDO CommPar	Reading/writing
1401	RECORD	2 <sup>nd</sup> receive PDO parameter	PDO CommPar	Reading/writing
1402	RECORD	3 <sup>rd</sup> receive PDO parameter	PDO CommPar	Reading/writing
1403	RECORD	4 <sup>th</sup> receive PDO parameter	PDO CommPar	Reading/writing
1600	RECORD	1 <sup>st</sup> receive PDO mapping	PDO Mapping	Reading/writing
1601	RECORD	2 <sup>nd</sup> receive PDO mapping	PDO Mapping	Reading/writing
1602	RECORD	3 <sup>rd</sup> receive PDO mapping	PDO Mapping	Reading/writing
1603	RECORD	4 <sup>th</sup> receive PDO mapping	PDO Mapping	Reading/writing
1800	RECORD	1 <sup>st</sup> transmit PDO parameter	PDO CommPar	Reading/writing
1801	RECORD	2 <sup>nd</sup> receive PDO parameter	PDO CommPar	Reading/writing
1802	RECORD	3 <sup>rd</sup> receive PDO parameter	PDO CommPar	Reading/writing
1803	RECORD	4 <sup>th</sup> receive PDO parameter	PDO CommPar	Reading/writing
1A00	RECORD	1 <sup>st</sup> transmit PDO mapping	PDO Mapping	Reading/writing
1A01	RECORD	2 <sup>nd</sup> transmit PDO mapping	PDO Mapping	Reading/writing
1A02	RECORD	3 <sup>rd</sup> transmit PDO mapping	PDO Mapping	Reading/writing
1A03	RECORD	4 <sup>th</sup> transmit PDO mapping	PDO Mapping	Reading/writing

## 1.7 OBJECTS' DICTIONARY : MANUFACTURER SPECIFIC PROFILE AREA

The words reported in bold type can be mapped in PDO.

Index (hex)	Object	Type	Name	Description	Access
2000	VAR	INTEGER16	Block size	SDO Block size Block Download	Reading/writing
2001	VAR	DOMAIN	Tab_formati	Formats of the 200 parameters (P00...P199)	reading
2002	VAR	DOMAIN	Tab_con_formati	Formats of the 100 connections (C00...C99)	reading
2003	VAR	DOMAIN	Tab_exp_int	Formats of the 128 internal values (D00...D127)	reading
2004	VAR	DOMAIN	Tab_exp_osc	Formats of the 100 monitor's sizes (o00...o99 see in real time graph)	reading
2005	VAR	DOMAIN	Tab_par_def	Values of the default parameters (P00...P199)	reading
2006	VAR	DOMAIN	Tab_con_def	Values of the default connections (C00...C99)	reading
200D	ARRAY	INTEGER16	Tab_par [200]	Actual values of the parameters (P00...P199)	reading/writing
200E	ARRAY	INTEGER16	Tab_con [100]	Actual values of the connection (C00...C99)	reading/writing
200F	ARRAY	INTEGER16	Tab_int [128]	Actual values of the internal words (D00...D127)	reading
2010	ARRAY	INTEGER16	Tab_inp_dig[32]	Actual values of the logical input's functions (I00...I31)	reading

Index (hex)	Object	Type	Name	Description	Access
2011	ARRAY	INTEGER16	Tab_out_dig[64]	Actual values of the logical output's functions (o00...o63)	reading
2012	ARRAY	INTEGER16	Tab_osc [100]	Actual values of the checked words (o00...o99 see in real time graph)	reading
2013	VAR	UNSIGNED8	Inp_dig_connettore	Logical status of the 8 inputs of the terminal board (physical input status)	reading
2014	VAR	UNSIGNED8	ingressi_hw	Logical status of the 3 inputs from the power	reading
2015	VAR	UNSIGNED8	uscite	Logical status of the 4 digit outputs (physical output status)	reading
2016	VAR	UNSIGNED 32	Out_dig_appl	Reading application outputs	reading
2017	VAR	UNSIGNED16	stato	Variable of the drive's status	reading
2018	VAR	UNSIGNED16	allarmi	Drive alarms' status	reading
2019	VAR	UNSIGNED16	abilitazione_allarmi	Mask for enabling drive's alarms	reading
201A	VAR	INTEGER16	rif_fieldbus	Speed reference in % of n <sub>MAX</sub> in 16384	reading/writing
201B	VAR	INTEGER16	limitrif_fieldbus	torque limit in % di Tnom in 4095	reading/writing
201C	VAR	INTEGER16	trif_fieldbus	torque reference in % di Tnom in 4095	reading/writing
201D	VAR	INTEGER16	theta_fieldbus	Speed reference in electr. pulses x Tpwm	reading/writing
201E	ARRAY	INTEGER16	Tab_dati_applicazione [100]	Actual values of the application parameters (E00...E99)	reading/writing
201F	VAR	UNSIGNED32	Inp_dig_fiel	Logical inputs function by fielbus	reading/writing
2020	VAR	UNSIGNED32	Inp_dig	Actual values of the logical input's functions (I00...I31)	reading
2021	VAR	UNSIGNED32	Out_dig	Actual values of the logical output's functions (o00...o63)	reading
2022	VAR	UNSIGNED16	word_vuota	Unused Word	reading/writing
2023	VAR	UNSIGNED32	double_vuota	Unused Double word	reading/writing
2024	VAR	DOMAIN	Tab_formati_appl	Formats of application parameters (E00...E99)	reading
2025	ARRAY	INTEGER16	Tab_codice_allarmi[16]	Alarms subcode	reading
2026	VAR	UNSIGNED32	Quota_att	Actual multi-turn position	reading
2028	VAR	UNSIGNED32	letto	Actual position on turn	reading
2029	VAR	UNSIGNED32	letto_senza_top	Actual incremental position on turn	reading
202A	VAR	INTEGER16	letto2	Actual second sensor position on turn	reading
202B	ARRAY	INTEGER16	Tab_extra_int [70]	Actual extra internal values	reading
202C	ARRAY	INTEGER16	Tab_comandi [12]	Utilities commands (U00...U09)	reading/writing

## 1.8 MAPPING\_CONFIG

This parameter configures the shown value on PDO\_MAPPING parameter. MAPPING\_CONFIG is used for diagnostic troubleshooting. The parameter is expressed in hexadecimal format. The Tab. 4.2 shows the possible MAPPING\_CONFIG value.

Name	MAPPING_CONFIG	Description	PDO_MAPPING
0 h	0 h	0 h	0 h
RxPDO 1	10 h	Number of mapped objects	Visualizes the number of mapped objects
	11 h	1st mapped object	Visualizes the 1st mapped object
	1x h	xth mapped object	Visualizes the xth mapped object
	18 h	8th mapped object	Visualizes the 8th mapped object
RxPDO 2	20 h	Number of mapped objects	Visualizes the number of mapped objects
	21 h	1st mapped object	Visualizes the 1st mapped object
	2x h	xth mapped object	Visualizes the xth mapped object
	28 h	8th mapped object	Visualizes the 8th mapped object
RxPDO 3	30 h	Number of mapped objects	Visualizes the number of mapped objects
	31 h	1st mapped object	Visualizes the 1st mapped object
	3x h	xth mapped object	Visualizes the xth mapped object
	38 h	8th mapped object	Visualizes the 8th mapped object
RxPDO 4	40 h	Number of mapped objects	Visualizes the number of mapped objects
	41 h	1st mapped object	Visualizes the 1st mapped object
	4x h	xth mapped object	Visualizes the xth mapped object
	48 h	8th mapped object	Visualizes the 8th mapped object
TxPDO 1	50 h	Number of mapped objects	Visualizes the number of mapped objects
	51 h	1st mapped object	Visualizes the 1st mapped object
	5x h	xth mapped object	Visualizes the xth mapped object
	58 h	8th mapped object	Visualizes the 8th mapped object
TxPDO 2	60 h	Number of mapped objects	Visualizes the number of mapped objects
	61 h	1st mapped object	Visualizes the 1st mapped object
	6x h	xth mapped object	Visualizes the xth mapped object
	68 h	8th mapped object	Visualizes the 8th mapped object
TxPDO 3	70 h	Number of mapped objects	Visualizes the number of mapped objects
	71 h	1st mapped object	Visualizes the 1st mapped object
	7x h	xth mapped object	Visualizes the xth mapped object
	78 h	8th mapped object	Visualizes the 8th mapped object
TxPDO 4	80 h	Number of mapped objects	Visualizes the number of mapped objects
	81 h	1st mapped object	Visualizes the 1st mapped object
	8x h	xth mapped object	Visualizes the xth mapped object
	88 h	8th mapped object	Visualizes the 8th mapped object

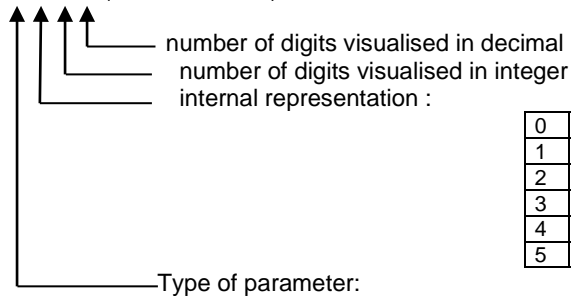

## 1.9 FORMAT

### 1.9.1 Format Parameters Table (Tab\_Format 2001h)

This table is made by 800word (200\*4) 4 words for each parameter :

1<sup>st</sup> word : it defines the parameter typology, its internal representation and the number of decimal and integer digits which are shown up on the display. Each nibble has the following meaning:

0x 0 0 0 0 (in hexadecimal)

0	Direct value
1	Percent of the base (100/base)
2	Proportional to the base (1/base)
3	Direct value unsigned
4	Less significant word (32 bit Par)
5	Most significant word (32 bit Par)

0	Not managed
1	free (changeable on-line)
2	Reserved (changeable off-line + key P60)
4	TDE (changeable off-line + key P99)

For example:

0x1231 → free parameter proportional to the base: the real value is = internal representation/base (4<sup>th</sup> word).

2<sup>nd</sup> word : it defines the min. value admitted in the internal representation of the parameter

3<sup>rd</sup> word : it defines the max value admitted in the internal representation of the parameter

4<sup>th</sup> word : it defines the representation base of the parameter

example 1: (hexadecimal if leaded by '0x...'):

1<sup>st</sup> word = 0x1131

2<sup>nd</sup> word = 0000 free parameter in percent of the base: the real value is = (internal representation divided by the base)\*100

3<sup>rd</sup> word = 8190

4<sup>th</sup> word = 4095

if the current value is 1000 →  $(1000/4095)*100 = 24,4\%$   
the variation range is included between 0 and 200%

example 2 : (hexadecimal if leaded by '0x...'):

1<sup>st</sup> word = 0x2231

2<sup>nd</sup> word = 5 reserved parameter proportional to the base : the real value is internal representation divided by the base

3<sup>rd</sup> word = 1000

4<sup>th</sup> word = 10

if the current value is 400 →  $(400/10) = 40,0\%$   
the variation range is included between 0,5 and 100%

## 1.9.2 Format Connections Table (Tab\_With\_Formats 2002h)

This table is composed by 400 words (100x4), 4words for each connection:

1<sup>st</sup> word : it defines the type of connection ,its internal representation and the number of integer and decimal digits that will show up on the display. Each nibble has the following meaning:

0x 0 0 0 0 (hexadecimal)

0	Direct value
1	Percent of the base (100/base)
2	Proportional to the base (1/base)

0	Not managed
1	free (changeable on-line)
2	Reserved (change off-line + key P60)
4	TDE (change off-line + key P99)

2<sup>nd</sup> word : it defines the min admitted value in the internal representation of the connection

3<sup>rd</sup> word : it defines the max admitted value in the internal representation of the connection

4<sup>th</sup> word : it defines the base of the representation of the connection (always 1)

The internal representation is always the direct value.

Example (hexadecimal if leaded by '0x...') :

1<sup>st</sup> word = 0x2020

2<sup>nd</sup> word = 0 reserved connection : its value is included between 0 and 18

3<sup>rd</sup> word = 18

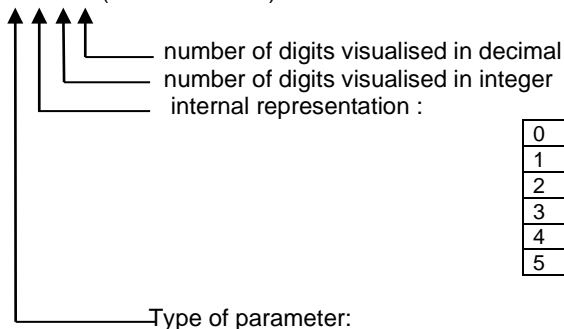

4<sup>th</sup> word = 1

## 1.9.3 Format Extra Parameters Table (Tab\_Format 2024h)

This table is made by 1000word (200\*5) 5 words for each parameter :

1<sup>st</sup> word : it defines the parameter typology, its internal representation and the number of decimal and integer digits which are shown up on the display. Each nibble has the following meaning:

0x 0 0 0 0 (in hexadecimal)

0	Direct value
1	Percent of the base (100/base)
2	Proportional to the base (1/base)
3	Direct value unsigned
4	Less significant word (32 bit Par)
5	Most significant word (32 bit Par)

0	Not managed
1	free (changeable on-line)
2	Reserved (changeable off-line + key P60)
4	TDE (changeable off-line + key P99)

For example:

0x1231 → free parameter proportional to the base: the real value is = internal representation/base (4<sup>th</sup> word).

2<sup>nd</sup> word : it defines the min. value admitted in the internal representation of the parameter

3<sup>rd</sup> word : it defines the max value admitted in the internal representation of the parameter

4<sup>th</sup> word : it defines the representation base of the parameter

5<sup>th</sup> word : it defines the default value of the parameter

example: (hexadecimal if leaded by '0x...'):

1<sup>st</sup> word = 0x1131  
 2<sup>nd</sup> word = 0000  
 3<sup>rd</sup> word = 8190  
 4<sup>th</sup> word = 4095  
 5<sup>th</sup> word = 4095

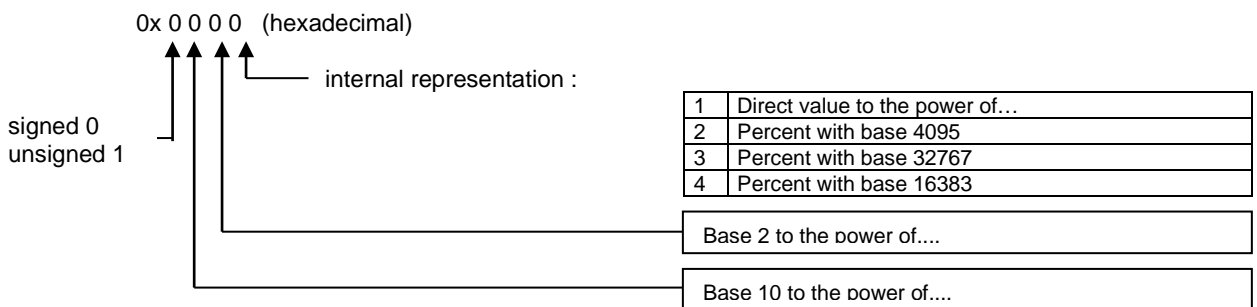

free parameter in percent of the base: the real value is = (internal representation divided by the base)\*100

if the current value is 1000 →  $(1000/4095)*100 = 24,4\%$   
 the variation range is included between 0 and 200%  
 the default value is 100%

### 1.9.4 Format Of Internal Values Table (Tab\_Exp\_Int 2003h)

This table is composed by 64 words, one word for each internal value :

1<sup>st</sup> word : it defines the representation of the internal values

example 1 (hexadecimal if leaded by '0x...')

0x0002 internal representation of the value : percent of 4095.

For example if its value is 2040 →  $(2040/4095)*100 = 49,8\%$

Example 2 (hexadecimal if leaded by '0x...')

0x0041 internal representation of the size : direct value divided by 2<sup>4</sup>

For example if its value is 120 →  $(120/2^4) = 7,5$

### 1.9.5 Format Of Monitor Values Table (Tab\_Exp\_Osc 2004h)

This table is composed by 64 words, one word for each monitor value.

1<sup>st</sup> word : it defines the representation of internal values :

example 1 (hexadecimal if leaded by '0x...'):

0x0003 internal representation of the internal value: percent of 32767.

For example if its value is 5000 →  $(5000/32767)*100 = 15,2\%$

## 1.9.6 Management Of Speed Sensor (Hw\_Software 2007h And Hw\_Sensor 2008h)

The two variables hw\_software and hw\_sensor can assume the following values :

value	Corresponding sensor
0	--- none ---
1	Incremental encoder
2	Incremental encoder + Hall probes
4	Resolver
8	Sinusoidal encoder Sin/Cos analog
9	Sinusoidal encoder Sin/Cos absolute analog
10	Endat

hw\_software represents the managed sensor of the version of the drive firmware.  
hw\_sensor represents the sensor managed by the feedback board mounted in the drive.

## 1.9.7 Management Of Monitor (Objects From 2009h To 200ch + 2012h)

These objects are related to the monitor of the drive internal values.

**K\_zz** (2009h) is the internal counter of the 2000 points circular buffer.

**Start\_count** If ≠0 it indicates that the trigger event set with C14 went off

**Tab\_monitor\_A** (200Bh) and **Tab\_monitor\_B** (200Ch) are circular buffer where the internal values selected by C15 and C16 are stored

Moreover parameter P54,P55 and P56 are involved. P54 sets the sample time of the monitor( units = PWM period); P55 sets the post-trigger points; P56 sets the trigger level if this is effectuated on the monitored internal values

See the product documentation for detailing of the monitored internal values

The object **Tab\_osc** (2012h) is an array of 64 internal values with the most recent values of all the monitoring variables. In this way the single objects can be mapped as PDOs to keep under control the internal values of the drive.

## 1.9.8 Input Logic Functions (Object 2010h, 2013h, 2014h, 2016h, 201fh, 2020h, 2021h, 2022h)

The management of the input logic functions is totally controlled via CAN.

In the variable inputs (**2013h**) it is possible to read the status of the 8 input available in the terminal-box in the less significant bit. The 8 logic input are configured by the C1-C8 connections, each one checking a particular input logic function.

### Standard input logic functions (I00 ÷ I28)

The status of the 32 input logic functions is available in two different dictionary objects:

the array **Tab\_inp\_dig** (2010h) in which it's possible to read function by function using sub-index ( logic state 0 = low ; 32767 = high) and the 32 bit variable **Ingressi\_standard\_rd** (2021h) in which every bit is related to the state of corresponding function.

Via CAN it's possible to set the status of the input logic functions: writing function by function with the array **Tab\_inp\_dig\_field** (2016h) (0=low, 32767=high) or setting the state of all 32 logic functions writing the 32bit variable **Ingressi\_standard\_wr** (201Fh).

The implemented logic provides that:

- The 0 logic input function (drive switch on/off) is given by the logic AND of the different input channels : terminal board, field-bus and serial line
- All the other logic functions can be set high by the logic OR of the different channels.

At start up, Tab\_inp\_dig\_field [0]=high : in this way if this value is never over-written, the drive can be controlled via terminal-board.

### Application input logic functions (I29 ÷ I63)

The status of the 32 application input logic functions is available in the 32 bit variable **Ingressi\_appl\_rd** (2022h) in which every bit is related to the state of corresponding function.

Via CAN it's possible to set the status of all application input logic functions writing the 32bit variable **Ingressi\_appl\_wr** (2020h).

The implemented logic provides that:

- The 32 application input logic functions can be set via CAN
- If one application input logic function is configured to a connector logic input, the physical state imposes the state of corresponding logic function.

### 1.9.9 Output Logic Functions (Objects 2011h, 2015h, 2023h)

Via CAN bus, it is possible the monitoring the state of :

- the status of the 4 logic outputs in the 4 less significant bits of the variable output (2015h)
- the status of the 32 logic output functions in the array Tab\_out\_dig (2011h) using the sub-index. Like the inputs logic levels are: 0=low and 32767=high
- the status of all 32 output logic functions in the 32 bit variable Uscite\_logiche\_rd (2023h) in which every bit is related to the corresponding function

### 1.9.10 Status Words (Objects 2017h, 2018 And 2019h)

the object 2017h is available as status word of the drive with the following meaning:

The object 2018h is available as the status of the different alarms of the drive bit by bit; for example, the status of A8 alarm is shown by the bit n.8 of the word.

The object 2019h is the alarm enabling mask. Again the meaning is bit by bit. This variable is available as read only access ; see parameter P163 for read and write access.

### 1.9.11 Control Reference Via Fieldbus (Object 201ah, 201bh,201ch And 201dh)

These objects can be used to give: speed-reference, torque-reference, torque-limit to the drive. For doing this it is necessary to enable their management, setting C52=1.

**f\_fieldbus (201A)** = speed reference in percent of the max speed set. Base representation is equal to 16384; thus 16384 is equal to 100%.

**Theta\_fieldbus (201D)** = speed reference in electric pulses per period of PWM, considering that there are 65536 pulses per revolution and that the term 'electric' means they must be multiplied by the number of polar pairs of the motor.

**Trif\_fieldbus (201C)** = couple reference in percent of the nominal torque of the motor. Base of Representation = 4095 : thus 4095 is = 100%

**Limit\_fieldbus (201A)** = torque limit in percent of the nominal torque of the motor ( it is in alternative to the other existing limits, the most restricted is the one that values). Representation base is 4095 : thus 4095 = 100%
